BBC APPLE II, II E, IBM PC DRAGON

ELECTRON

**TRACKBALL :** The low cost peripheral which provides precise X-Y cursor position control by simple fingertip movement of the central ball. Instant start-stops. Amazing directional change. More precise and stable than joysticks because of the Trackball potentiometer gearing.

Less space needed than a mouse. Operate from the lap. Easy to use for long periods of time. Really tough.

**INTERFACING :** Joystick and analogue ports are used so that the vast amounts of existing joystick software can generally still be used in addition to new Wigmore packages and utilities.

**TECHNOLOGY :** The 2.25" ball is in slip contact with three points which drive two shafts at right angles and utilise potentiometers selected for their accuracy and durability.

**APPLICATIONS :** TRACKBALL is intended for hobbyists, educational establishments, users of popular graphics and low cost CAD/CAM. Boost game scores with dual fire control and exploit the speed, precision and flexibility of this exciting cursor controller in games, graphics and menu selection.
