VOLTMACE DELTA 14B HANDSETS

DELTA 14B HANDSET AND DELTA 14B/1 ADAPTOR BOX FOR THE BBC MICRO

The DELTA 14B handsets are lightweight easy to hold units with a sensitive sprung return to centre joystick combined with a 14 button keypad. Both the stick and the keypad were developed in a video game environment over a number of years to produce a tried and tested reliable unit. The versatility of the BBC machine means that the joystick system is programmable and programs written for the keyboard can be intercepted at the indirection point and diverted to include the keypad. You can even convert software written for keys only to be joystick controlled. Away from games the DELTA 14 can be used as a numeric keypad or to duplicate any other keyboard keys that have an ASCII value. The handset comes complete with suggested listings for inclusion in your own programs or to load and run before other programs to convert them to the keypad.

One handset will plug into the analogue 15 way 'D' socket on the rear of the micro and will run games written for joysticks. An adaptor box plugs between the handset and the micro and joins by cable to the user port and now you can use the full benefit of the keys and conversion programs. A second joystick can plug into the adaptor box. The second joystick socket also gives access to two A/D channels and some of the user port for external devices which may be required at the same time as a joystick.
